Connectivity Overview - Simplified

Money Loop / Hot Loop

Connectivity Overview - Reality

Problem Statement

- You are an execution researcher at Optiver.
- We are connecting to a new exchange and you have access to trade data from the exchange arriving at different capture points (handoffs).
- Due to the costs associated with maintaining multiple connections we are looking to select the best pair of handoffs to connect to.
- You will need to investigate the dataset provided.

The Task

- I am the CEO of Optiver.
- I need you to send me **an email presenting your proposal** for which 2 handoffs you would like to select including evidence supporting this proposal.
- Propose how many, and which, additional handoffs you would choose if you could select more than 2.
- Include 1 interesting feature that you discover in the data as a postscript (PS).
- This is an open-ended task and there may not necessarily be a single 'best' answer.
- I, the CEO of Optiver, am a highly important and busy person so:
 - I will only read content within the **first 20 seconds of the email**.
 - I will only read email that arrive in my inbox **before 2pm**.
 - The content will need to be digestible to me as a layman.

How (not) to write an email

The Minto Principle

- The Minto Pyramid Principle is a communication framework developed by Barbara Minto at McKinsey.
- The core idea: Start with the answer first, then provide supporting arguments.
- Structure
 1. Lead with your conclusion/recommendation at the top
 2. Support with key arguments (typically 3)
 3. Provide evidence/details underneath each argument
- Why it works
 - Busy readers get the main point immediately
 - They can choose to stop reading or dig deeper
 - Arguments are logically grouped and easier to follow

Send

Dear Ram,

Handoffs 12 and 11 are the best pair to use when connecting to the new exchange. As you can see in the graph below, handoffs 11 and 12 are the largest numbers by magnitude.

Handoff Magnitude

Handoff Number	Magnitude of number
1	1
2	2
3	3
4	4
5	5
6	6
7	7
8	8
9	9
10	10
11	11
12	12

Some additional supporting evidence can be found below:
